

# The `bmpsize` package

Heiko Oberdiek\*

2019/12/29 v1.8

## Abstract

Package `bmpsize` analyzes bitmap images to extract size and resolution data. It adds this feature to the `graphics` package that now do not need separate bounding box files for bitmap images. Additionally the implementation for the inclusion of bitmap images in some drivers of package `graphicx` are rewritten to support options `viewport`, `trim` and `clip`.

# 1 Documentation

## 1.1 Introduction

The support of bitmap images in the  $\text{\TeX}$  world is quite poor.  $\text{\TeX}$  can read text files and thus parse the bounding box of EPS files, but it cannot read binary files. If  $\text{\TeX}$  reads a line, it removes spaces before the line end and normalizes the line end itself to get independent from the convention of the operating system.

The situation changed with pdf $\text{\TeX}$ . It is a  $\text{\TeX}$  compiler, where the output driver is already integrated. Images of type JPEG and PNG are supported directly and the size of the images are reported back to the  $\text{\TeX}$  language. Thus it is easy for package `graphics` to get the size of the images.

The problem remains for other drivers than pdf $\text{\TeX}$  in PDF mode. The size information must either be given manually by the bounding box options or an additional file is used for each image, where the size information is stored as EPS bounding box. Program `dvips` comes with the program `ebb` that create these `.bb` files. However it ignores the natural size of the image and uses a fixed resolution of 100 DPI.

Since pdf $\text{\TeX}$  1.30.0 there are some new primitives. Especially `\pdffiledump` is very helpful. It reads a file in binary mode and reports the selected area as hex dump. It works in both DVI and PDF mode of pdf $\text{\TeX}$ . Thus it is now possible to read and parse bitmap files to get their size. This project uses this feature to implement parsers for many bitmap file types.

## 1.2 Bitmap image parsers

This project supports the following image types:

BMP, GIF, JPEG, MSP, PAM, PCX, PNG, PNM, SGI, TGA, TIFF, WMF, XPM

Consult the documentation of your T<sub>E</sub>X distribution and driver which types are supported by your driver. Sometimes automatically triggered conversions can be configured to extend the range of supported image types.

### 1.2.1 User interface

Package `bmpsize` hooks into package `graphics`. If an image is included and its size is not given, then `bmpsize` investigates the image. If it could be parsed as known bitmap file type, the size is reported back to package `graphics`.

The following options are added to the options of package `graphicx`:

**resolutionunit:** Specifies the unit of the options for setting the resolution. Default is `1in` that means the numbers are interpreted as dots per inch (DPI).

**defaultresolution:** Bitmap files do not always provide information about their resolution (density). If this information is not given, the values of this option are used to calculate the image size. Default: `72 !`

**resolution:** This option override the resolution given in the bitmap file.

**bmpsizefast:** Values are `true` and `false`. The option is enabled by default. Then mainly  $\epsilon$ -T<sub>E</sub>X's arithmetic is used to calculate the width and height. However the dimen dimensions are limited. Therefore overflow errors can happen. Disable then this option to use the arithmetic of package `fp`. It allows a larger range of numbers at the cost of speed.

Options `defaultresolution` and `resolution` expect two numbers, separated by a space. The first is taken as density for the horizontal x axis, the second for the vertical y axis. One of the numbers may be replaced by an exclamation mark. In this an aspect ratio is respected and the correct density for this axis automatically calculated. If one number is given, this number is used for both axes. Examples:

```
defaultresolution=72 !      % Default
resolution=100             % Simulates behaviour of program ebb
```

The options can be set in `\includegraphics` or using `\bmpsizesetup`. `\setkeys{Gin}` is equivalent to the latter case.

```
\bmpsizesetup{resolutionunit=1in, resolution=100}
\includegraphics[
  defaultresolution=72 !,
  bmpsizefast=false
]{image}
```

### 1.2.2 Hints

- My version of `dvips.def` 1999/02/16 v3.0i defines rules for the supported bitmap extensions, but does not include them in the list of extensions that are tried if the file name is not given with an extension. In such a case, the list of extensions can be set by `\DeclareGraphicsExtensions`, see `grfguide`. The following code just extends the list:

```
\makeatletter
\g@addto@macro\Gin@extensions{.bmp,.pcx,.msp}
\makeatother
```

- My version of `dvipdfm.def` 1998/11/24 vx.x misses the graphics rule for PNG files. It can be added by:

```
\DeclareGraphicsRule{.png}{bmp}{.bb}{#1}
```

See the previous issue to add the extension `.png` to the list of extensions for package `graphics`.

### 1.2.3 Test program

There is a test program `bmpsize-test.tex`. Run it through `latex`, `pdflatex`, or `pdftex`. Then given image files are inspected and the result is printed.

### 1.2.4 Interface for programmers

The macro names of the parsers are `\bmpsize@read@<type>`. Example: `\bmpsize@read@jpg` in case of JPEG.

A parser sets the switch `\ifbmpsize@ok` to true, if it could successfully parse the image file. The width and height are returned in `\bmpsize@width` and `\bmpsize@height`. If information about density is available, it is used to calculate width and height of the image, otherwise the values given by option `defaultresolution` is used. `resolution` overwrites the values in the image file.

## 1.3 Improved bitmap inclusion

Some drivers for package `graphics` define the `graphics` type `bmp` for bitmap images. The code in the standard drivers for `dvips`, `dvipdfm`, and `dvipdfmx` is very basic and misses essential features of the package `graphicx`. Therefore the code for bitmap inclusion is automatically rewritten by this package to add the following features:

- Support for `viewport` and `trim`.
- Support for `clip`.
- In case of `dvipdfm` and `dvipdfmx` the bitmap images are reused and not included again if they are used more than once.

However, there is a difference between `dvipdfm` and `dvipdfmx`, especially if images are reused. In the former case the reused box has width and height of 1bp, in the latter case its natural width. Thus the correct driver option must be given. `dvipdfm` and `dvipdfmx` are not equivalent.

Older versions of `dvipdfmx` uses a size of 1in. However I do want to distinguish between versions of the same program. Therefore the support of these older versions has stopped with version 1.6 of this package. Use version `dvipdfmx-20090708` or newer (some few versions before will probably also work, but I don't want to investigate this further).

## 2 Implementation

### 2.1 Basic package `bmpsize-base`

Identification.

```
1 <*base>
2 \ProvidesPackage{bmpsize-base}%
3 [2019/12/29 v1.8 Basic part of bmpsize (H0)]%
```

Modules of package `fp` are used for calculations.

```
4 \RequirePackage{fp-basic}
5 \RequirePackage{fp-snap}
```

Package `fp` uses nested `\loop` structures. That breaks with the plain-`TeX` version of `\loop`. Therefore we use the `LATEX` variant.

```
\@bmpsize@plain@loop
6 \long\def\@bmpsize@plain@loop#1\repeat{%
7   \def\iterate{%
8     #1\relax
9     \expandafter\iterate\fi
10  }%
11  \iterate
```

```

12 \let\iterate\relax

1943 }%
1944 \fi

```

Support for viewport/trim. The original bounding box is '0 0 width height'. If package `bmpsize` is used and the image has been recognized, then the original width and height are known (`\bmpsize@width`, `\bmpsize@height`). Otherwise we try the saved values `\Gin@ourx` and `\Gin@oury`. This guessing will fail, if options `viewport` and `trim` are used both or several times. This is a deficiency of package `graphicx`. One of options `viewport` and `trim` should be used at most once.

The file name is given as PDF string in the image special. If we have pdfTEX with `\pdfescapestring` we use it.

`\bmpsize@pdfescapestring`

```
2022 \begingroup\expandafter\expandafter\expandafter\endgroup
2023 \expandafter\ifx\csname pdf@escapestring\endcsname\relax
2024 \def\bmpsize@pdfescapestring#1{#1}%
2025 \else
2026 \let\bmpsize@pdfescapestring\pdf@escapestring
2027 \fi
```

The size of reused images of dvipdfm 0.13.2c is 1bp. It is the default size of an image object in user space. Thus the reused image must be scaled to the requested width and height. The factor is just the conversion from pt to bp (72/72.27).

`\bmpsize@dvipdfm@factor`

```
2028 <dvipdfm>\def\bmpsize@dvipdfm@factor{.99626}
```

Unhappily dvipdfmx behaves differently. It remembers the size assuming a resolution of 100 dots per inch and additionally scales the reused image to this size. Thus the scaling factor also depends on the pixel sizes of the image:

- width:  $(72 / 72.27) * (100 / 72) / \text{pixelwidth} = 100 / 72.27 / \text{pixelwidth}$
- height:  $100 / 72.27 / \text{pixelheight}$

Recent versions however use the natural size of the reused image. Thus the factor is the difference between the requested size and the natural size.

`\Gininclude@bmp` Added features: support for viewport/trim, clip, and image reuse.

```
2029 \def\Gininclude@bmp#1{%

## 3 Installation

### 3.1 Download

**Package.** This package is available on CTAN<sup>1</sup>:

[CTAN:macros/latex/contrib/oberdiek/bysize.dtx](#) The source file.

[CTAN:macros/latex/contrib/oberdiek/bysize.pdf](#) Documentation.

**Bundle.** All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](#)

*TDS* refers to the standard “A Directory Structure for  $\TeX$  Files” ([CTAN:pkg/tds](#)). Directories with `texmf` in their name are usually organized this way.

### 3.2 Bundle installation

**Unpacking.** Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

### 3.3 Package installation

**Unpacking.** The `.dtx` file is a self-extracting docstrip archive. The files are extracted by running the `.dtx` through plain  $\TeX$ :

```
tex bysize.dtx
```

---

<sup>1</sup>[CTAN:pkg/bysize](#)

**TDS.** Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

```
bmpsize.sty      → tex/latex/oberdiek/bmpsize.sty
bmpsize-base.sty → tex/latex/oberdiek/bmpsize-base.sty
bmpsize-dvips.def → tex/latex/oberdiek/bmpsize-dvips.def
bmpsize-dvipdfm.def → tex/latex/oberdiek/bmpsize-dvipdfm.def
bmpsize-dvipdfmx.def → tex/latex/oberdiek/bmpsize-dvipdfmx.def
bmpsize.pdf      → doc/latex/oberdiek/bmpsize.pdf
bmpsize.dtx      → source/latex/oberdiek/bmpsize.dtx
```

If you have a `docstrip.cfg` that configures and enables `docstrip`'s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

### 3.4 Refresh file name databases

If your  $\TeX$  distribution ( $\TeX$  Live, MiK $\TeX$ , ...) relies on file name databases, you must refresh these. For example,  $\TeX$  Live users run `texhash` or `mktextlsr`.

### 3.5 Some details for the interested

**Unpacking with  $\LaTeX$ .** The `.dtx` chooses its action depending on the format:

**plain  $\TeX$ :** Run `docstrip` and extract the files.

**$\LaTeX$ :** Generate the documentation.

If you insist on using  $\LaTeX$  for `docstrip` (really, `docstrip` does not need  $\LaTeX$ ), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{bmpsize.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

**Generating the documentation.** You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with `pdf $\LaTeX$` :

```
pdflatex bmpsize.dtx
makeindex -s gind.ist bmpsize.idx
pdflatex bmpsize.dtx
makeindex -s gind.ist bmpsize.idx
pdflatex bmpsize.dtx
```

## 5 History

### [2006/08/24 v1.0]

- First version.

### [2007/02/18 v1.1]

- `lin` replaced by `72.27pt`, because TeX is inaccurate if `lin` is given.

### [2007/04/11 v1.2]

- Line ends sanitized.

### [2007/05/01 v1.3]

- Uses package `infwarerr`.
- Image reuse algorithm fixed for `dvipdfmx`.
- Some support for Exif's orientation tag.

### [2007/11/11 v1.4]

- Use of package `pdftexcmds` for LuaTeX support.
- Fix of bug of package `keyval`: `\KV@err` and `\KV@errx` are used, but undefined if loaded by plain TeX.

### [2008/08/11 v1.5]

- Code is not changed.
- Update of URLs.

### [2009/09/04 v1.6]

- Fixes for reusing objects with `dvipdfmx-20090708`. Older versions of `dvipdfmx` are no longer supported.

### [2016/05/16 v1.7]

- Documentation updates.

### [2019/12/29 v1.8]

- Use `iftex` package not `ifpdf`.
